

No chance for viruses and bacteria:

Keyboard protection foils do not allow germs or pathogens to pass through

Germering, April 2023. tastaturen.com introduces durable and sterile keyboard protection films as a cost-effective alternative to hygienic DIN IP68 protected keyboards. The foils have an ultra-thin but effective protective layer that shields against the penetration of infectious germs and pathogens. The robust protective foils

are made of polyurethane and fit over the keys almost like a second skin. GeBE offers many different sizes from different manufacturers.

Disinfection and service life

The films should be cleaned thoroughly with water and disinfectants on a regular basis. The protective films do not contain polybrominated diphenyl ethers and are free of halogens and latex. They have a service life of about 10 million strokes.

The right model for every keyboard

An overview over the available keyboard protection skins you'll find on our website www.tastaturen.com, Keyboard skins. For further questions please contact us by email to sales@tastaturen.com.
